Relay Wire Protocol v2

1. Scope

This document specifies the binary frame header used between relay gateways and workers. All multi-byte integers are big-endian (network byte order).

2. Frame header

The header layout is given in Table 1 on the next page.

A receiver MUST reject a frame whose magic or version does not match.

Table 1 - Frame header (16 bytes)

Field	Offset	Size	Type	Notes
magic	0	2	uint16	always 0x5244 ("RD")
version	2	1	uint8	must be 2
flags	3	1	uint8	bit0 compressed
				bit1 encrypted
length	4	4	uint32	payload bytes
request_id	8	8	uint64	unique per request
